Template:Networking device power consumption

The following values are measurements of {{{name}}} minimum, maximum and idle power consumption.

Minimum	Idle	Maximum
{{{minimum}}} W	{{{idle}}} W	{{{maximum}}} W

The minimum values are reached when all processes are switched off, peripherals disabled. Idle values are achieved simply after the firstboot, without changing the device's parameters. All default peripherals on. The maximum values are calculated by theoretically estimating the potential maximum consumption of the components.
