

Talk:RUT955

Hi all I should want to use the RUT955 device in a special application where I need to manage dynamically the interfaces (Wi-Fi, LAN and Mobile). WAN interface operating mode is "Main/Backup": The Main interface is WIFI and the Backup one is Mobile. The RUT955 unit acts as Wireless station mode and as Wireless Access Point

First Scenario: I need to switch-on the LAN ports and switch-off the Wireless Access Point Mode when NO client is connected to the Access point

Second Scenario: I need to switch-off the LAN ports and switch-on the Wireless Access Point functionality when the WIFI main interface is not connected to the configured SSID network

And finally, in correspondence of the two scenarios, I want to activate or deactivate the device onboard Outputs

Can I have indications on how to write script in order to solve the problem?

Thanks

latest model

I want to buy a RUT955 but I am confused for the latest model: some pictures show green connectors, others pictures show black connectors. Could you explain that and give the latest model number ? Thank you
